

ELECTIVE COURSES

CURRENT ELECTIVE MODULES BACHELOR ARCHITECTURE

Module title
Presentation Strategies
Presentation Strategies
Special Topics in Structural Design
Context: Architecture and Landscape
Cultural Competence
Special area of building theory
Drawing for architects
Design strategies
Special topics in a historical context
Special topics in technology
Designing in timber construction
Building information modeling
Campus credits
Special topics in architecture
Documentation, Reflection
Designing in Detail
Workshops and symposia
Student competitions
Artistic Design I

Information on the elective modules:

At the end of each semester, the examination board for the Architecture program in the Design department publishes a catalog for the Bachelor's program in Architecture with the courses offered in the following semester. In addition, Bachelor's students are informed again at the beginning of their studies about the options available in the elective area. Furthermore, the lecturers present the modules during the first week of lectures.

Module enrollment:

According to the curriculum for the Bachelor's program in Architecture, students take one elective module per semester from the 3rd to the 6th semester, so that by the end of their studies, students have completed a total of four elective modules from the range of electives on offer. All elective modules are worth 3 ECTS credits and have a contact time of 2 SWS.

Module title: Presentation Strategies				Module no.: BAR WM 1	
Module duration	Semester in which the module takes place	Frequency		Credit points (ECTS)	Weighting of the grade for the final grade
1 Semester	From the 3rd semester	☐ Every winter semester ☐ every summer semester ☒ if necessary		3 ECTS	Based on the subject-specific study regulations
Courses/Teaching methods		Contact time	Self-study	Total workload for students	
Lecture, seminar, exercise		2 hours per week / 30 hours	60 hours	90 hours	
Competency goals (learning outcomes)					
▪ In the elective module "Presentation Strategies," students learn in-depth presentation and layout techniques at different scales. ▪ By analyzing exemplary plan presentations and the presentation techniques they have learned, they will be able to present their own designs in the best possible way using the options available to them. ▪ Students will learn to visually present various presentation and layout techniques to a group.					
Contents					
▪ In 12 steps, each student designs a small project, lays it out in the best possible way in different variants, explains it, presents it, and makes it presentable for print or online media. This includes the presentation of floor plans, sections, and elevations, as well as explanatory pictograms, interior and exterior perspectives, site plans and black plans, texts, headings, and the selection of the appropriate sheet format. ▪ At the end of the module, the work is presented in a competition, evaluated by a jury, and prizes are awarded to the best-presented work. ▪ The competition criteria focus less on the quality of the design and more on the presentation techniques used.

Module title: Presentation strategies				Module no.: BAR WM 2	
Module duration	Semester in which the module takes place	Frequency		Credit points (ECTS)	Weighting of the grade for the final grade
1 Semester	From the 3rd semester	☐ Every winter semester ☐ Every summer semester ☒ as needed		3 ECTS	Based on the subject-specific study regulations
Courses/teaching methods		Contact time	Self-study	Total workload for students	
Lecture, seminar, exercise		2 hours per week / 30 hours	60 hours	90 hours	
Competency goals (learning outcomes)					
▪ Students use their personal presentation strategies to communicate and disseminate project information in the best possible way. ▪ To do this, they use specific tools such as text, pictograms, and verbal strategies.					
Contents					
▪ Using a clear draft project, strategies for textual and verbal explanations as well as for various forms of presentation are taught and developed. ▪ In a second step, the drafts are made presentable for print or online media. ▪ The various forms of presentation must support the draft as effectively as possible and be structured according to the logical sequence of an oral project explanation. ▪ Clear "redrawings" of the project parts are converted into easily understandable and quickly readable graphics for publication on the Internet. ▪ This module is linked in terms of content to the elective module "Presentation Strategies." Together, both modules teach specific skills in the areas of layout, text, and presentation.

Module title: Special Topics in Structural Design				Module no.: BAR WM 3	
Module duration	Semester in which the module takes place	Frequency		Credit points (ECTS)	Weighting of the grade for the final grade
1 Semester	From the 3rd semester	☐ Every winter semester ☐ Every summer semester ☒ as needed		3 ECTS	Based on the subject-specific study regulations
Courses/teaching methods		Contact time	Self-study	Total workload for students	
Lecture, seminar, exercise		2 hours per week / 30 hours	60 hours	90 hours	
Competence goals (learning outcomes)					
▪ Students are able to evaluate supporting structures for specific performance criteria, taking into account appropriate methods and the respective material properties. ▪ The mutual interactions between form, structural system, building materials, and structural design in the context of sustainable structural design can be identified and discussed. ▪ Students will be able to classify complex technical relationships and evaluate them with regard to their own design task. ▪ Students will have the ability to document and present the knowledge they have gained in a scientifically adequate and creatively appealing manner.					
Contents					
▪ Development of scientifically sound fundamentals for specific types of supporting structures, joining techniques, and building materials with regard to load-bearing capacity, sustainability, and architectural expression. ▪ Transfer of the theoretical knowledge acquired to specific applications ▪ Elaboration of the results in the form of, for example, project designs, execution details, preliminary dimensioning or dimensioning tables, or similar. ▪ Introduction to advanced methods of structural design.

Module title: Context Architecture and Landscape				Module no.: BAR WM 4	
Module duration	Semester in which the module takes place	Frequency		Credit points (ECTS)	Weighting of the grade for the final grade
1 Semester	From the 3rd semester	☐ Every winter semester ☐ Every summer semester ☒ as needed		3 ECTS	Based on the subject-specific study regulations
Courses/Teaching methods		Contact time	Self-study	Total workload for students	
Seminar		2 hours per week / 30 hours	60 hours	90 hours	
Competency goals (learning outcomes)					
▪ Students are able to study selected examples of landscape architecture in various cultural, social, geographical, and architectural contexts through source research, description, analysis, and evaluation. ▪ They are able to deconstruct these project examples into their design-relevant components using graphic representations. ▪ Students learn about the space-creating potential of landscape architecture. ▪ They are prepared for communication and cooperation with landscape architects.					
Contents					
▪ The integration of outdoor spaces into the design of architecture and urban planning. Landscape architecture as an expanding potential for architectural and Urban design. Recognizing parallels in strategies and concepts, distinguishing between the means employed. ▪ The outdoor space as a conceptual component of architecture: generating and/or supporting concepts. ▪ Landscape architecture / architectural landscapes: interfaces between architecture and landscape architecture. ▪ Cooperation with international universities of landscape architecture.

Module title: Cultural Competence			Module no.: BAR WM 5	
Module duration	Semester in which the module takes place	Frequency		Credit points (ECTS)
1 Semester	From the 3rd semester	☐ Every winter semester ☐ Every summer semester ☒ as needed		3 ECTS
Courses/Teaching methods		Contact time	Self-study	Weighting of the grade for the final grade
Variable, determined on a case-by-case basis, usually project work		2 hours per week / 30 hours	60 hours	Based on the subject-specific study and examination regulations
Total workload for students				
90 hours				
Competence goals (learning outcomes)				
▪ Students learn about the points of contact between architecture and related disciplines, as well as the culturally determined differences in creative work. ▪ They engage in exchange with students and teachers from other disciplines in different cultural and linguistic areas. ▪ They are able to use this diversity as a special potential for their own work. ▪ They are able to relate their own discipline to other areas of culture and to make connections between them.				
Contents				
▪ International studies or internships / excursions abroad / international workshops / cross-country and cross-disciplinary activities and collaborations. ▪ Activities that make architecture tangible in the context of culture and cultural identity. ▪ Networking with foreign universities on international topics.				
Usability of the module

Module title: Special Areas of Building Design				Module no.: BAR WM 6	
Module duration	Semester in which the module takes place	Frequency		Credit points (ECTS)	Weighting of the grade for the final grade
1 Semester	From the 3rd semester	☐ Every winter semester ☐ Every summer semester ☒ as needed		3 ECTS	Based on the subject-specific study regulations
Courses/Teaching methods		Contact time	Self-study	Total workload for students	
Lecture, seminar, exercise		2 hours per week / 30 hours	60 hours	90 hours	
Competency goals (learning outcomes)					
▪ Students understand and analyze buildings as systems of organizational, spatial, structural, technical, legal, and economic interrelationships. ▪ You will understand typological principles and commonalities and recognize buildings as building blocks and variants of larger—even global—categories. ▪ You will gain in-depth knowledge based on selected building examples from higher-level functional areas. ▪ You will learn methods of building analysis with regard to function, efficiency, and sustainability. ▪ Students will learn to document aspects of building theory and then present them to a group.					
Contents					
▪ Each semester and on a rotating basis, building examples and principles from the following areas are examined in depth and analytically with regard to organizational, structural, technical, and technical aspects typical of the period: buildings related to mobility, buildings for leisure, cultural buildings (museums and exhibition buildings, theaters, opera houses, libraries, and media centers), buildings for education, research, and teaching, high-rise buildings, and sacred buildings are dealt with in depth and analytically with regard to organizational, structural, technical, and spatial developments typical of the time. ▪ The main topics are typological aspects of buildings and their use, including in the context of sustainability and sufficiency.					
Usability of the module

Module title: Drawing for Architects				Module no.: BAR WM 7	
Module duration	Semester in which the module takes place	Frequency		Credit points (ECTS)	Weighting of the grade for the final grade
1 Semester	From the 3rd semester	☐ Every winter semester ☐ Every summer semester ☒ as needed		3 ECTS	Based on the subject-specific study regulations
Courses/teaching methods		Contact time	Self-study	Total workload for students	
Seminar, exercise, excursion		2 hours per week / 30 hours	60 hours	90 hours	
Competency goals (learning outcomes)					
▪ Ability to represent a spatial idea through a spatial hand sketch, to be able to review it, and to communicate it to others. ▪ Ability to continuously review and develop one's own design work using spatial sketches. ▪ Ability to create freehand, manual axonometric and perspective drawings in orthogonal systems. ▪ Ability to create compositions of objects in space freehand. ▪ Ability to develop a personal and comprehensible visual language for the qualified evaluation of three-dimensional objects.					
Contents					
▪ Topics: Basic geometric shapes and spaces, addition/subtraction/rotation, proportion grids, perspective representations, simple shadow constructions. ▪ Foreground/background – positive/negative. ▪ Depiction of fictional, imaginary architectural objects. ▪ Depiction of realistic architecture, rooms, and spaces. ▪ Drawings for implementation in model-making workshops. ▪ Representation in black and white and color.

Module title: Design Strategies			Module no.: BAR WM 8	
Module duration	Semester in which the module takes place	Frequency of offering		Credit points (ECTS)
1 Semester	From the 3rd semester	☐ Every winter semester ☐ Every summer semester ☒ as needed		3 ECTS
Courses/Teaching methods		Contact time	Self-study	Total workload for students
Workshop, seminar, exercise		2 hours per week / 30 hours	60 hours	90 hours
Competence goals (learning outcomes)				
▪ Students will have the ability to design and manage the design process, including basic knowledge of networked working methods and the interlocking of different methodologies. ▪ Through independent research, you can develop creative goals, develop a personal visual language, and present the content you have developed.				
Contents				
▪ By searching for the appropriate design strategy for the design task and design presentation, methodological tools for reducing design complexity are learned. ▪ Classic design strategies and design conventions are questioned, while at the same time developing different personal "signatures" and spatial discoveries. ▪ Material experiments and a focus on sub-areas and guiding ideas take place under topics such as "design strategies as a plastic medium" and "between functionalism doctrine and the principle of chance." ▪ There is an intensive exchange of ideas and skills among students, and interdisciplinary approaches are required.				
Usability of the module

Module title: Special topics in a historical context				Module no.: BAR WM 9	
Module duration	Semester in which the module takes place	Frequency of offering		Credit points (ECTS)	Weighting of the grade for the final grade
1 Semester	From the 3rd semester	☐ Every winter semester ☐ Every summer semester ☒ as needed		3 ECTS	Based on the subject-specific study regulations
Courses/teaching methods		Contact time	Self-study	Total workload for students	
Seminar, exercise		2 hours per week / 30 hours	60 hours	90 hours	
Competence goals (learning outcomes)					
▪ Students are able to understand and evaluate the historical context of a simple urban development situation and to design an architecturally appropriate building project in the form of an extension, addition, or restructuring.					
Contents					
▪ Theme-based "research" project work. ▪ Project proposal for the project idea, design, construction, and communication of a spatial object, implementation, and documentation in dialogue between existing and new buildings.					
Usability of the module

Status: WS 2025/2026

Module title: Special Topics in Technology				Module no.: BAR WM 10	
Module duration	Semester in which the module takes place	Frequency		Credit points (ECTS)	Weighting of the grade for the final grade
1 Semester	From the 3rd semester	☐ Every winter semester ☐ Every summer semester ☒ as needed		3 ECTS	Based on the subject-specific study regulations
Courses/Teaching methods		Contact time	Self-study	Total workload of the student	
Seminar, exercise		2 hours per week / 30 hours	60 hours	90 hours	
Competence goals (learning outcomes)					
▪ Students develop and learn the content and methods of a selected, specific topic in technology in an architectural context and practice integrating them into architecture.					
Content					
▪ Depending on the task at hand, different topics related to technology in architecture and building design are covered: – Knowledge transfer from other disciplines to architecture, – Bionics – learning from nature and transferring and implementing these findings in construction, – Building construction, – joining materials and elements, – Designing, developing, and optimizing supporting structures, – Integration of architectural concept and technology, – Temporary, adaptive, interactive, and transformable architecture, – industrial construction, – Consideration of aspects such as manufacturing and assembly in architectural design.

Module title: Designing in timber construction				Module no.: BAR WM 11	
Module duration	Semester in which the module takes place	Frequency		Credit points (ECTS)	Weighting of the grade for the final grade
1 Semester	From the 3rd semester	☐ Every winter semester ☐ Every summer semester ☒ as needed		3 ECTS	Based on the subject-specific study regulations
Courses/teaching methods		Contact time	Self-study	Total workload for students	
Seminar, exercise		2 hours per week / 30 hours	60 hours	90 hours	
Competence goals (learning outcomes)					
Students deepen their knowledge from BAR 3.3 Design III Wood construction methods in building designs of medium difficulty or in experimental wood construction methods.					
- You will be able to implement timber construction methods and mixed timber construction methods in your own designs, taking into account design and engineering aspects. - You have an advanced understanding of timber construction and mixed timber construction, as well as building physics and structural engineering (e.g., interpretation of the Glaser diagram, design principles of DIN EN 1995-1-1). - You develop details and can apply them to medium-sized and larger timber structures (up to five-story buildings, hall structures with bracing principles, renovation measures), taking into account design and material-specific features. - You will have learned to analyze different timber construction methods and present them visually to a group.					
Contents					
Students are taught the following course content:					
- In-depth content on material-specific properties such as strength classes, swelling and shrinkage behavior with calculation approaches. - Building physics expertise with the development of heat, sound, and moisture-specific criteria. - Development of fault-tolerant component cross-sections and construction methods, partly using the building physics program U-WERT RECHNER. - In-depth examination of contemporary construction methods (frame construction, solid wood construction, and HBV construction methods), including on your own designs. - In-depth knowledge of wood-based materials, modified wood, and fiber insulation materials in terms of their application. - In-depth study of traditional timber construction methods (roofs, half-timbered structures, post-and-beam and log construction) and traditional timber joints. - Teaching of design principles for multi-axis support systems, spatial structures, grids, and shells in wood. - Familiarization with design approaches in timber engineering using approximate verifications in accordance with DIN EN 1995-1, EC 5. - Expanded basic knowledge of fire protection in timber construction using simplified verification in accordance with EN 13501 and DIN 4102.

Competency goals (learning outcomes)					
▪ Simple planning tasks are used to teach students not only technical knowledge, but also how to structure teamwork and presentation techniques. ▪ Team-oriented planning with students from other disciplines, e.g., in cooperation with the civil engineering department.					
Contents					
▪ Teaching of specialist knowledge in Building Information Modeling (BIM) using Rhino D3, Autodesk Revit, ArchiCad, or similar software. ▪ In the future, traditional construction drawings will increasingly be replaced by highly integrated digital building models. These models go far beyond purely graphic representations of buildings in terms of information density far beyond purely graphic representations of buildings and integrate data from specialist planners and other planning participants at an early stage.

Module title: Campus Credits				Module no.: BAR WM 13	
Module duration	Semester in which the module takes place	Frequency		Credit points (ECTS)	Weighting of the grade for the final grade
1 Semester	From the 3rd semester	☐ Every winter semester ☐ Every summer semester ☒ as needed		3 ECTS	Based on the subject-specific study regulations
Courses/teaching methods		Contact time	Self-study	Total workload for students	
Seminar, exercise		2 hours per week / 30 hours	60 hours	90 hours	
Competency goals (learning outcomes)					
▪ Ability to plan, organize, implement, and document various cultural activities within the Department of Design and the participating degree programs. ▪ Development of a sense of responsibility for the university. ▪ Ability to plan programs and events.					
Contents					
▪ Activities that promote both subject-specific and interdisciplinary skills, such as: Organization of lecture series/conferences/film events on cross-disciplinary and subject-specific topics. ▪ Conception and realization of exhibitions or exhibition series. ▪ Documentation of activities related to degree programs and student research projects. ▪ Maintenance of the alumni network.					
Usability of the module

Max. participants

17

Status: WS 2025/2026

Module title: Documentation, Reflection				Module no.: BAR WM 15	
Module duration	Semester in which the module takes place	Frequency of the course		Credit points (ECTS)	Weighting of the grade for the final grade
1 Semester	From the 3rd semester	☐ Every winter semester ☐ Every summer semester ☒ as needed		3 ECTS	Based on the subject-specific study regulations
Courses/teaching methods		Contact time	Self-study	Total workload for students	
Project, supervision		2 hours per week / 30 hours	60 hours	90 hours	
Competence goals (learning outcomes)					
▪ Students can design and develop meaningful structural alternatives for the design project and select a structural system that is consistent with the concept. ▪ A suitable building material for the load-bearing components can be selected based on the function and concept of the project. ▪ Students can explain the vertical load transfer (dead loads, live loads, and imposed loads) and horizontal load transfer (wind, earthquakes) of their chosen structure and name the components intended for this purpose (columns, wall panels, bracing, etc.). ▪ Students can measure the slenderness of the supporting structure using rough rules of thumb. ▪ Students attempt to harmonize the three virtues of architecture: utility, strength, and beauty, bringing together architectural concept, organizational chart, and supporting system into a holistic unit—architecture—in a process of development and consideration. ▪ Students have learned how to present a design project visually and verbally to a group.					
Contents					
▪ Constructive and structural engineering support and advice is offered as part of design projects and final theses. ▪ The starting point is always the task and theme of the design project as well as the architectural intention of the student. ▪ Based on this, different alternatives for structural systems are designed and examined for their potential for the task or concept. Can these structures fulfill the load-bearing task? Can they even inspire the design process? ▪ The most suitable structural systems and appropriate building materials are selected for the intended use, load transfer, and architectural effect. ▪ Designing structural elements for vertical load transfer to absorb dead loads, live loads, and imposed loads (columns, walls, etc.). ▪ Designing structural elements for horizontal load transfer to absorb wind and earthquake forces (bracing, etc.). ▪ Integration of concept, use, and construction, form, function, and force into a holistic architecture.

Module title: Design in Detail				Module no.: BAR WM 16	
Module duration	Semester in which the module takes place	Frequency		Credit points (ECTS)	Weighting of the grade for the final grade
1 Semester	From the 3rd semester	☐ Every winter semester ☐ Every summer semester ☒ as needed		3 ECTS	Based on the subject-specific study regulations
Courses/teaching methods		Contact time	Self-study	Total workload for students	
Exercise, project		2 hours per week / 30 hours	60 hours	90 hours	
Competence goals (learning outcomes)					
▪ Students have a general understanding of the design options available in detailed planning, including the choice of materials, their processing, and the possibilities for surface treatment. ▪ They recognize the consequences that arise from the limitations of technical possibilities. ▪ They develop a sense that, even at the design planning stage, a design idea depends on its feasibility in detail and that, conversely, the detail can inspire the entire design. ▪ Students have the ability to present a detailed object they have designed themselves in detail to a group.					
Contents					
▪ Design of a simple structure, facade, or similar using a solid building material, brick, or concrete. ▪ Examination of individual details that are crucial in terms of design and construction. ▪ Presentation of the design, including details, in the form of a rendering. ▪ Possible construction of a detail or a sample on a scale of 1:1 using the original materials.

Module title: Student competitions				Module no.: BAR WM 18	
Module duration	Semester in which the module takes place	Frequency		Credit points (ECTS)	Weighting of the grade for the final grade
1 Semester	From the 3rd semester	☐ Every winter semester ☐ Every summer semester ☒ as needed		3 ECTS	Based on the subject-specific study regulations
Courses/ Teaching methods		Contact time	Self-study	Total workload for students	
Seminar, exercise		2 hours per week / 30 hours	60 hours	90 hours	
Competence goals (learning outcomes)					
- National and international student competitions serve to compare design ideas with other students and universities. They are an important tool for raising the profile of students and the university. - Competition strategies and modes of expression are developed that provide the best possible preparation for a career as an architect with a focus on design.					
Contents					
- Students learn to research competitions on their own initiative, evaluate their content, and apply for them. - They learn to read and understand the competition documents. - Strategies are taught and demonstrated for how to successfully complete competitions. From design development to elaboration and presentation to time management. - In addition to graphic representation methods, practices and techniques for visualization and model building are also taught.

Seminar, exercise		2 hours per week / 30 hours	60 hours	90 hours	
Competency goals (learning outcomes)					
▪ Students will gain an overview of the possibilities of wood for sculptural production in a historical and contemporary context and will learn about the basic material properties of wood. ▪ They have knowledge of basic sculptural concepts and form analysis. ▪ They apply various artistic woodworking techniques in a targeted manner and are able to combine traditional craftsmanship with contemporary themes. ▪ You have learned to visually present the artistic techniques you have used in a sculpture to a group.					
Contents					
▪ Systematic analysis and description of sculptural works. ▪ Promotion of spatial imagination and clarification of the relationship between form and content. ▪ Independent, creative implementation of a contemporary theme. ▪ Adequate handling of fragile materials using various processing techniques. ▪ Training of fine motor skills.

Module title: Anthropology and Cultural Studies / Humans and the Built Environment				Module no.: BAR WM 20	
Module duration	Semester in which the module takes place	Frequency		Credit points (ECTS)	Weighting of the grade for the final grade
1 Semester	From the 3rd semester	☐ Every winter semester ☐ Every summer semester ☒ as needed		3 ECTS	Based on the subject-specific study regulations
Courses/teaching methods		Contact time	Self-study	Total workload for students	
Seminar, exercise		2 hours per week / 30 hours	60 hours	90 hours	
Competency goals (learning outcomes)					
▪ The module provides architects with an introduction to scientific reflection on human perception, feeling, judgment, memory, habits, attitudes, and actions. ▪ Students acquire the necessary basic knowledge of cultural studies issues and methods, including anthropology, neuroscience, body history, and gender studies. ▪ After successfully completing the module, students will be able to classify historical developments and controversial positions on an exemplary topic and apply them to the current discourse. ▪ Students learn to establish the social and ecological context of architecture and other structures in public and private spaces. They are able to accurately grasp and interpret the significance and influence of material culture. ▪ Students have criteria and tools for integrating the experiences and usage patterns of residents and users into planning and design.					
Contents					
▪ Experimental observation tasks and interactions to discover the interplay between the body, social events, cultural images, and material resources (auto-ethnography). ▪ Existing routines of perception and action relating to space, movement, and buildings are challenged and alternatives developed. Interactive experiments, excursions, and group work are central to this. ▪ Selected topics in material cultural history are made accessible and understandable using current examples from architectural discourse. ▪ Basic texts on material aesthetics and multimodal perception in cognitive psychology and cultural studies are studied and discussed. ▪ The module offers students the opportunity to reflect on their own designs from an anthropological or cultural studies perspective.

Module title: Architecture and Urban History				Module no.: BAR WM 21	
Module duration	Semester in which the module takes place	Frequency		Credit points (ECTS)	Weighting of the grade for the final grade
1 Semester	From the 3rd semester	☐ Every winter semester ☐ Every summer semester ☒ as needed		3 ECTS	Based on the subject-specific study regulations
Courses/ Teaching methods		Contact time	Self-study	Total workload for students	
Seminar, exercise		2 hours per week / 30 hours	60 hours	90 hours	
Competency goals (learning outcomes)					
▪ Students can identify and derive specific characteristics of architectural and design development in an urban or suburban context. ▪ Students qualify themselves through in-depth research on transculturality, regional identity, and postcolonial design and architectural history. ▪ Students have learned to describe, work on, document, and present aesthetic, architectural history, and social science issues. ▪ Students can transfer methods and knowledge from case studies and expertise on the Greater Region to other regions and architectural traditions, or identify analogies and interactions.					
Contents					
▪ Students learn about research, standards, and the fundamentals of architectural history as well as spatial and urban research. ▪ Current issues relating to transformation, mobility, social justice, cultural identity, and ecological necessity are addressed, explored in depth, and examined in specific cases. ▪ Perception, appreciation, and appropriation are the focus of experimental self-experiments on site and using concrete examples of architectural and design development. ▪ Intercultural and non-human aspects of architecture and space utilization expand and change classic categories. ▪ Site visits, inspections, work in archives and collections, and interactive formats are central components of learning.
